of the thousands of biomarkers that are currently being discovered relatively few are being validated for further applications and the potential of a biomarker can be quite difficult to evaluate to aid in this imperative research. Dr Kewal K Jain's handbook of biomarkers thoroughly describes many different types of biomarkers and their discovery using various omics technologies such as proteomics and metabolomics along with the background information needed for the evaluation of biomarkers as well as the essential procedures for their validation and use in clinical trials with biomarkers described first according to technologies and then according to various diseases. This detailed book features the key correlations between diseases and classifications of biomarkers which provides the reader with a guide to sort out current and future biomarkers comprehensive and cutting edge. The handbook of biomarkers serves as a vital guide to furthering our understanding of biomarkers which by facilitating the combination of therapeutics with diagnostics promise to play an important role in the development of personalized medicine one of the most important emerging trends in healthcare today.

The possibility of treating cancer, a disease defined by genetic defects by introducing genes targeting these very alterations has led to an immense interest in gene therapy for cancer although incremental successes have been realized. Enthusiasm for gene therapy has declined due to an increasing number of obstacles. These obstacles include vector systems that do not reach systemic metastases, therapeutic genes with redundant mechanisms allowing for cellular resistance and toxicities in clinical trials leading to premature closure of these studies. Different tactics to overcome or circumvent these obstacles have catalyzed the development of a wide range of gene therapy approaches. Thus far almost two thirds of gene therapy trials have focused on cancer. This reflects the concept that gene therapy approaches for the treatment of cancer do not necessarily require long term expression of the gene as is necessary for the treatment of primary genetic defects like hemophilia or juvenile diabetes. Unlike the treatment of genetic defects where expression of the corrected gene needs to be strong, permanent and sometimes regulated, tactics to treat tumors can be based on temporary and locally limited effects. In addition cancer cells have different properties than normal cells and this allows for targeting gene therapy to specific cells. A major advantage over current antitumor therapies which are also toxic to normal cells and tissues.
